Mail OTP

[email](#) [mail](#) [secure](#) [message](#)

1. Overview

This guide will show how to set up the email settings for sending MAIL OTP. If one needs to change or to add Localized Message then navigate to the following documentation [Message Templates](#).

2. Config Mail Server

SMTP mail servers can be used by WebADM for sending emails. Therefore add your mail server settings in the following configuration file `/opt/webadm/conf/servers.xml`. If no server is specified, WebADM will use the local mailer in `/usr/sbin/sendmail` to send emails.

```
-bash-4.2# vi /opt/webadm/conf/servers.xml
<?xml version="1.0" encoding="UTF-8" ?>

<Servers>

<!--
*****
***  WebADM Remote Server Connections  ***
*****
...
<!--
SMTP mail servers can be used by WebADM for sending emails.
If no server is specified, WebADM will use the local mailer
in /usr/sbin/sendmail to send emails.
-->

<!--
<MailServer name="SMTP Server"
    host="localhost"
    port="25"
    user=""
    password=""
    encryption="NONE"
    ca_file="" />
-->

</Servers>
```

Please remove `<!--` and `-->` to activate the MailServer configuration. Replace the default settings with your SMTP mail server settings. Finally, restart WebADM with `/opt/webadm/bin/webadm restart`. Have a look below for an example.

```

-bash-4.2# vi /opt/webadm/conf/servers.xml
<?xml version="1.0" encoding="UTF-8" ?>

<Servers>

<!--
*****
***  WebADM Remote Server Connections  ***
*****
...
<!--
SMTP mail servers can be used by WebADM for sending emails.
If no server is specified, WebADM will use the local mailer
in /usr/sbin/sendmail to send emails.
-->

<MailServer name="SMTP Server"
    host="www.rcdevs.com"
    port="25"
    user="loic"
    password="{wcrypt}00ycjL0MoL51xy6D0vc0MA=="
    encryption="NONE"
    ca_file="" />

```

```
</Servers>
```

```

-bash-4.2# /opt/webadm/bin/webadm restart

-bash-4.2#
```

In this example, the password has been encrypted. This feature requires an Enterprise License and the encryption mechanism is bound to secret data in your encoded license file. Please follow this documentation [RCDevs Utilities and Command Line Tools for WebADM](#).

3. Config Email

3.1 Test Email

First, select the `test_user` on the left side. It has no email address, add it under `Add Attribute` add `Email Address`.

Now, the `test_user` has got an email address.

Let's check if WebADM is able to send an email. Therefore, we click under `Application Actions` on `Secure Password Reset`.

This is the default output, let's continue with changing the sender's email.

3.2 Sender Email

To configure the sender email, edit the WebADM configuration file `/opt/webadm/conf/webadm.conf` by removing the `#` in front of `org_from` and replacing the default sender email. Save the changes and restart WebADM with `/opt/webadm/bin/webadm restart`.

```
-bash-4.2# vi /opt/webadm/conf/webadm.conf
#
# WebADM Server Configuration
#
...
# Personalization options
# You can customize your organization's name, logo file and website URL.
# The logo file must be a PNG image under conf/ with a size of 100x50 pixels.
#org_name "RCDevs SA"
#org_logo "rcdevs.png"
#org_site "http://www.rcdevs.com/"
#org_from "noreply@rcdevs.com"
...
```

```
-bash-4.2# vi /opt/webadm/conf/webadm.conf
#
# WebADM Server Configuration
#
...
# Personalization options
# You can customize your organization's name, logo file and website URL.
# The logo file must be a PNG image under conf/ with a size of 100x50 pixels.
#org_name "RCDevs SA"
#org_logo "rcdevs.png"
#org_site "http://www.rcdevs.com/"
org_from "noreply@rcdevs.com"
...
```

Let's send again a test mail and verify that the sender email has changed to `noreply@rcdevs.com` instead of the default `PwReset@rcdevs.com`.

□

3.3 Alerts

Alerts are always recorded to the SQL Alert log. Additionally, when `alert_email` is defined, the alerts are also sent by email. To activate this feature, edit the configuration file of WebADM `/opt/webadm/conf/webadm.conf` by removing the `#` in front of `alert_email` and replacing the default email. Save the changes and restart WebADM with `/opt/webadm/bin/webadm restart`.

```
-bash-4.2# vi /opt/webadm/conf/webadm.conf
#
# WebADM Server Configuration
#
...
# Alerts are always recorded to the SQL Alert log. Additionally, when alert_email
# or alert_mobile is defined, the alerts are also sent by email/SMS.
#alert_email "me@mydomain.com"
#alert_mobile "+33 12345678"
...
```

```
-bash-4.2# vi /opt/webadm/conf/webadm.conf
#
# WebADM Server Configuration
#
...
# Alerts are always recorded to the SQL Alert log. Additionally, when alert_email
# or alert_mobile is defined, the alerts are also sent by email/SMS.
alert_email "testmail@rcdevs.com"
#alert_mobile "+33 12345678"
...
```

Let's engage an alert recorded to the SQL Alert log by setting a wrong time clock on the server. Do the following steps from this [documentation NTP \(Network Time Protocol\)](#). Afterward, restart WebADM.

□

To alert users via email when a login certificate or ActiveDirectory domain password is near expiration, set `user_warning` to `Yes`.

```
-bash-4.2# vi /opt/webadm/conf/webadm.conf
#
# WebADM Server Configuration
#
...
# Alert users via email when a login certificate or ActiveDirectory domain password
# is near expiration. The templates are defined in ldap_expire_XXX and cert_expire_XXX.
user_warning Yes
...
```

The templates for alerting users via email when a login certificate or ActiveDirectory domain password is near expiration are defined by `ldap_expire_XXX` and `cert_expire_XXX` in `/opt/webadm/conf/webadm.conf`. There, the messages can be changed and additional variables can be added. A notification email will be sent 5 days before the user's

password expiration and afterward every day until the password has been changed. The value is hardcoded.

```
-bash-4.2# vi /opt/webadm/conf/webadm.conf
#
# WebADM Server Configuration
#
...
# End-user message templates
# The following variables are available: %USERNAME%, %USERDN%, %USERID%, %DOMAIN%,
%APPNAME%
# Additional variables are available depending on the context: %APPNAME%, %APPID%,
%TIMEOUT%, %EXPIRES%
app_unlock_subject "Unlocked access to %APPNAME%"
app_unlock_message "Hello %USERNAME%,\r\n\r\nYou have a one-time access to the
%APPNAME%.\r\nYour access will automatically expire %EXPIRES%."
ldap_expire_subject "Login password near expiration"
ldap_expire_message "Hello %USERNAME%,\r\n\r\nYour login password will expire
%EXPIRES%.\r\nPlease reset your password before expiration!\r\n\r\nRegards"
cert_expire_subject "Login certificate near expiration"
cert_expire_message "Hello %USERNAME%,\r\n\r\nYour login certificate will expire
%EXPIRES%.\r\nPlease renew your certificate before expiration!\r\n\r\nRegards"
```

Finally, save the changes and restart WebADM with `/opt/webadm/bin/webadm restart`.

3.4 Mail OTP

To receive an OTP via Email, the user must have a mail value configured in mail or othermail attributes. To enable the OTP by Mail, there are multiple ways:

- > Under OpenOTP global configuration,
- > Under OpenOTP user settings configuration,
- > Under OpenOTP client policy configuration,

The `OTP Type` setting must be set to MAIL. In the following scenario, we use option 2 and will configure the WebADM user setting on the user object. On an activated user account, in `object Details` box, click on `CONFIGURE` button:

▬

Choose `OpenOTP` from the `Applications` box and set `OTP Type` to `MAIL`. Note that `MAIL OTP` may require longer timeouts, therefore enable the option `Challenge Session Timeout`. Furthermore, if needed enable the options under `User Notifications` as shown below.

▬

Enable the option `Send Blocking Notification` to send a notification email to the user when his account gets blocked.

Finally, the last options for OpenOTP. OnDemand Email Delivery Mode means a new OTP is sent when the user starts an authentication process. Next chapter, encrypt OTP email with the user certificate public key (S-MIME).

Let's test the Mail OTP by clicking **MFA Authentication Server** under **Application Actions**.

Now click on **Test User Authentication**.

Type in your LDAP password if the **Login Mode** is set to **LDAPOTP**. Click the **Start** button.

Now, switch to your email client and check your mail.

Finally, enter your OTP from the email and click **Continue**.

3.5 Encrypt Mail OTP

First, enable the option **Use Secure Email**. Have a look at the previous chapter.

Now, create a certificate through WebADM for the user in question. In this example, select the **test_user** on the left side and click on **Create certificate**.

Now, click the **Create Cert** button.

Click the **Download PKCS12** button to download the user's certificate. Import the certificate into your mail client.

Let's verify if the email is encrypted. Do the same steps as in the previous chapter for the

Test User Authentication.

In the header of the email, you can see that is has been encrypted.
